Languages

English	B2
Uzbek	Native
Korean	Topik 3

Education

Computer Engineering, Bachelor's - Dongseo University (English track)

 Busan, South Korea

 September 2016 - August 2020

Professional Experience

ZEROWEB - Full stack web developer

 Busan, South Korea

 August 2020 - PRESENT

- Developed API services and dashboards for internal R&D teams and a people counting system, supporting government projects with real-time data visualization and analytics.
- Designed and developed algorithms for data filtering from IR sensors for door monitoring and MAC addresses from access point routers to enable accurate people counting.
- Designed and developed optimized relational databases for over 10 projects, utilizing normalization, indexing, caching, and partitioning techniques to enhance performance and scalability.
- Engineered a high-performance CCTV streaming service with ONVIF protocol integration and optimized low-latency streaming for a government smart city initiative
- Developed pathfinding algorithms for subway indoor navigation. The algorithm caters to different user types (Normal, Elderly, Disabled, Blind), providing the shortest path for normal users and specialized paths for elderly and disabled users utilizing elevators.
- Deployed and managed Jenkins on internal servers to streamline CI/CD processes, drastically reducing the need for cloud services and cutting operational expenses.
- Designed and implemented microservices architecture to decompose monolithic applications, improving scalability and flexibility.

Development skills

TypeScript	ExpressJS
JavaScript	React
NodeJS	Jenkins
NestJS	Ubuntu Server
MySQL	ReactNative
MariaDB	Docker
Postgresql	AWS Cloud
MongoDB	Google Cloud
Redis	Git
Websockets	Bitbucket
Python	Django

Projects

CAREBELL

- Developing a healthcare solution that uses IoT sensors to monitor the health of elderly individuals in real-time. The system tracks vital signs like heart rate and blood pressure, sending alerts to caregivers when intervention is required. A mobile app enables users to access health data, while a dashboard helps caregivers monitor multiple patients remotely. The solution aims to enhance elderly care by ensuring timely responses to health changes
- Technologies Used: React, Node.js, WebSocket, ReactNative, MQTT, MariaDB, GoogleMaps, Mui, Mobx, Jenkins, Bitbucket
